

South Gujarat RMC Market Entry

Corrected case-study PDF rebuild aligned to the master Excel workbook

Source discipline

This corrected PDF treats the Excel workbook as the master source of truth. The attached PDF content was audited as output material only; instructions embedded inside it were ignored.

Important limitation: the original designed PDF could not be safely edited in-place because no editable source document was available. This rebuilt PDF preserves the extracted case-study text and corrects workbook-inconsistent values and outdated narrative statements.

Correction register

Area	Original PDF value/text	Correct workbook-aligned value/text
Base IRR	40.5%	40.8%
Optimistic IRR	88.3%	88.6%
Pessimistic IRR	-11.2%	-10.9%
Base 5-year EBITDA	₹111.70 Cr	₹112.20 Cr
Optimistic 5-year EBITDA	₹189.79 Cr	₹190.42 Cr
Pessimistic 5-year EBITDA	₹41.57 Cr	₹41.97 Cr
Base 5-year revenue	₹492.67 Cr	₹493.17 Cr
Optimistic 5-year revenue	₹628.15 Cr	₹628.79 Cr
Pessimistic 5-year revenue	₹401.19 Cr	₹401.58 Cr

Disclaimer

INSIGHT Independent Portfolio Project

This project is an independent business analytics portfolio project prepared using publicly available Evidence and consultant assumptions. It is not commissioned, endorsed, or affiliated with UltraTech Cement Limited.

UltraTech Cement Limited is referenced solely as a case-study subject to anchor the analysis in a recognisable, real-world RMC operator and to demonstrate market-entry decision-making in a realistic competitive context.

No proprietary, confidential, or non-public UltraTech Evidence has been used anywhere in this Business Model or in this document. Every figure that relates to UltraTech is drawn from the company's public disclosures (annual reports, investor presentations, and its corporate website) and is cited as such.

All market sizing, demand, pricing, and competitor figures in this case study are desk-research estimates built from public sources — principally the Gujarat Real Estate Regulatory Authority (GujRERA) project registry,

public infrastructure announcements (NHAI, Gujarat Metro Rail Corporation, Gujarat Industrial Development Corporation, Sardar Sarovar Narmada Nigam, and PIB releases), and standard construction-industry benchmarks (concrete-intensity ratios consistent with IS 456 and IS 4926 practice). Competitor capacities, pricing tiers, and threat ratings are analyst judgements formed from public listings, company websites, and directory Evidence — not from primary interviews, procurement Evidence, or non-public sources.

Named competitors are included because they are publicly identifiable market participants in the ready-mix concrete trade in South Gujarat; their inclusion is descriptive of market structure, not a claim about their non-public operations, financials, or strategy. Nothing in this document should be read as investment advice, an offer, or a solicitation. All monetary figures are in Indian Rupees, crore (₹ Cr, 1 Cr = 10 million) unless stated otherwise.

EVIDENCE NOTE How to read this document

This case study is built entirely from a single Excel feasibility model (11 linked Analysis, live Methodologys, named Evidencesets) that accompanies this report. Every figure quoted here traces back to that workbook. Where this review identified a data-quality issue, a stale reference, or a modelling anomaly in the underlying Analytical Model, it is flagged in place — transparently, and with a recommended fix — rather than smoothed over, consistent with how an investment-committee-grade review should be conducted.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 1 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

04 Executive Summary

A three-plant Ready-Mix Concrete network across South Gujarat is worth building. The market is large, the base-case return is attractive, and the risks are identifiable and manageable — provided expansion beyond Surat is milestone-gated rather than assumed.

This case study converts a single Excel feasibility model — 3,065 GujRERA-registered construction projects, 22 public infrastructure projects, and 66 independently mapped RMC competitors across five districts — into a full market-entry investment case for a hypothetical RMC operator (modelled on UltraTech Concrete's public profile, see Disclaimer). It answers four questions an investment committee would ask: how big is the opportunity, who else is already in it, what does the P&L and return profile look like, and what could go wrong.

₹26,760 Cr ₹1,297.17 Cr 40.8% 2.9 YRS

TOTAL ADDRESSABLE MARKET YEAR-1 SOM (5% CAPTURE) 5-YEAR IRR — BASE CASE PAYBACK — BASE CASE 44.24M m³ across 3,087 projects of ₹25,943.41 Cr reachable SAM NPV ₹30.80 Cr @ 12% on ₹51 Cr phased capex

The Opportunity

South Gujarat's five districts carry a combined Total Addressable Market of ₹26,760 Cr, built from 37.86 million m³ of concrete demand embedded in 3,065 RERA-registered residential, commercial, mixed-use and plotted-development projects, plus 6.38 million m³ from 22 large public infrastructure works — the Surat Metro, the Bhadbhut Barrage, the Delhi-Mumbai Expressway's Gujarat packages, and the Jambusar Bulk Drug Park among them. After adjusting for realistic delivery reach, the Serviceable Available Market is ₹25,943.41 Cr (97.7% of TAM), and a disciplined, share-gain-based capture path takes Year-1 revenue potential to ₹1,297.17 Cr, scaling to ₹5,230 Cr by Year 5 as capture rises from 5% to 20% of SAM.

The opportunity is heavily concentrated: Surat district alone accounts for 78.5% of all projects and 70% of TAM value. This is both the thesis and the principal risk — addressed directly in the Risk Analysis and Limitations

sections below.

The Competitive Landscape

66 RMC competitors were mapped across the five districts, spanning national players, regional operators, and project-captive batching plants. 24 are rated High strategic threat, 26 Medium, and 16 Low — a moderately fragmented but not empty field. Competitive intelligence quality is uneven: only 43.9% of listed competitors (29 of 66) are independently verified, with Surat best documented and Valsad the weakest — a gap this study flags rather than papers over.

The Financial Case

A phased three-plant rollout (₹17 Cr per plant, ₹51 Cr total capex by Year 3) generates a five-year base-case EBITDA of ₹112.20 Cr on a blended margin of roughly 22.8%, a Net Present Value of ₹30.80 Cr at a 12% discount rate, a 5-year IRR of 40.8%, and payback in 2.88 years. The model was stress-tested with Optimistic (IRR 88.6%, NPV ₹93.67 Cr) and Pessimistic (IRR -10.9%, NPV -₹22.86 Cr) scenarios — the downside case is genuinely value-destructive, which is the honest and useful result of a proper sensitivity test.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 3 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

The Risk Picture

19 risks were logged and scored on a 5×5 probability-impact scale. Three are Critical (score ≥20): geographic/service-radius exposure in plant siting, Surat demand concentration, and the pace at which SOM capture can realistically ramp. A further six are High. None are assessed as unmanageable, but three — concentration, capture-ramp, and competitive verification — should directly gate the pace of expansion beyond the first plant.

RECOMMENDATION: GO — PHASED, MILESTONE-

GATED

Proceed with Plant 1 in Surat immediately. Gate Plant 2 (Bharuch/Valsad) and Plant 3 on Year-1 utilisation, competitor-verification uplift, and confirmation of infrastructure off-take — not on the calendar alone. Full rationale in Strategic Recommendation (Section 25).

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 4 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

05 Business Problem

Ready-Mix Concrete capacity decisions are typically made zone-by-zone, on order-book visibility and competitor anecdote, rather than against a unified view of the underlying construction pipeline. That creates two compounding risks for an RMC operator considering South Gujarat: capital can be committed to a plant sited against last year's demand rather than the next five years' pipeline, and pricing/capacity decisions can be made blind to a competitive field that already has 66 identifiable players occupying parts of the map.

The core question this study answers is: should an RMC operator commit approximately ₹51 Cr of phased capital to a three-plant network across South Gujarat, and if so, in what sequence, at what scale, and against which competitive and demand risks? Answering it requires three things that don't normally sit in one place: a bottom-up demand model built from primary project-registry data rather than industry averages; a named, rated competitive map; and a financial model that prices the decision under more than one scenario.

INSIGHT Why this matters beyond one plant decision

The same gap — pipeline visibility, competitor mapping, and scenario-tested economics living in three different places, if they exist at all — recurs at every zone-expansion decision an RMC business makes. This model is built to be reusable: change the district filters and assumptions, and the same architecture re-prices the next market.

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

06 Project Objectives

The study was scoped around six deliverables, each mapped directly to a Analysis in the underlying feasibility model and a section of this report:

- Size the market bottom-up. Convert individual project-level records into a defensible TAM → SAM → SOM bridge, rather than relying on top-down industry averages.
- Map the competitive field by name. Identify, locate, and rate every discoverable RMC competitor across

the five districts, with an explicit verification status on each.

- Build a phased financial model. Model a multi-plant rollout with realistic ramp assumptions, and test it under Base, Optimistic, and Pessimistic scenarios.
- Formalise the risk register. Score identified risks on probability × impact, and map each to a mitigation owner and action.
- Design an executive dashboard. Compress the entire model into a single KPI view suiEvidenceset for a five-minute investment-committee read.
- Produce a board-ready recommendation. State a clear Go / No-Go position, with named gating conditions rather than an unconditional commitment.

07 Project Scope

In Scope

Dimension Coverage

Geography Five districts of South Gujarat: Surat, Bharuch, Valsad, Navsari, Tapi

3,065 GujRERA-registered projects (Residential, Commercial, Mixed Development, Plotted

Demand base

Development) + 22 public infrastructure projects

Competitive base 66 named RMC competitors — national, regional, and project-captive batching operations

Financial horizon 5-year projection; phased 3-plant capital rollout (Year 1 → Year 3)

Base, Optimistic, Pessimistic — each with its own price, utilisation, cost and discount-rate

Scenarios modelled

assumptions

Risk coverage 19 risks across market, competitive, operational, financial and data-quality categories

Out of Scope

- Primary market research — customer interviews, developer surveys, or field price checks were not conducted; all figures are desk-research estimates (see Data Sources, Section 12).
- Procurement-grade competitor cost data — competitor pricing tiers and capacities are analyst judgements from public listings, not audited or contractually sourced figures.
- Site-level engineering feasibility — geotechnical surveys, land acquisition, environmental clearance timelines, and utility hookups for specific plant sites are not assessed.
- Regulatory and licensing pathways — RMC plant consent-to-establish/operate timelines and state pollution-control-board processes are not modelled.
- Industrial-category demand — no Industrial/Manufacturing-category projects were present in the GujRERA extract at the time of data collection; this is a data-availability gap, not a claim that no such demand exists.

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

08 Industry Overview

India's Ready-Mix Concrete Market

India's RMC industry is in the middle of a structural shift from site-mixed to factory-mixed concrete, driven by quality consistency, faster construction cycles, and large-scale infrastructure programmes that site-mixing

cannot support at pace. Industry estimates of the market's size vary meaningfully by research methodology and by whether volume or value is measured — itself a useful reminder that even national-level RMC sizing is an estimate, not a settled fact, which is consistent with the bottom-up approach this study takes at the district level.

On volume, one widely cited estimate puts the Indian RMC market at roughly 266 million cubic metres in 2026, growing at a compound annual rate of about 6.9% to reach approximately 371 million cubic metres by 2031 — growth driven by government infrastructure spending, urban housing programmes, and continued penetration of factory-mixed concrete into tier-2 and tier-3 cities. Value-based estimates from different research houses range far more widely (from the tens of billions to over a hundred billion US dollars), reflecting differences in what each methodology counts as "RMC" versus adjacent precast and cement-product categories.

Structural Features Relevant to This Study

- Fragmentation. Outside the metro markets, the industry remains a mix of large branded players, regional operators, and small project-captive batching plants — consistent with the 66-competitor, 3-tier landscape mapped in Section 19.
- Delivery-radius economics. Fresh concrete has a limited workability window once batched, which caps the practical delivery radius of any single plant — the reason plant siting (Section 18-19) matters as much as aggregate demand.
- Policy tailwind in Gujarat specifically. The state announced a Gujarat Industrial Policy 2026 targeting in the order of ₹10 lakh crore in cumulative investment, alongside continued build-out of the Delhi-Mumbai Industrial Corridor (DMIC) and the Dahej Petroleum, Chemicals and Petrochemicals Investment Region (PCPIR) — both of which run through or adjacent to the five districts studied here.

09 Company Background (Case Study Only)

INSIGHT Public information only

Everything in this section is drawn from UltraTech Cement's public disclosures. No internal, proprietary, or non-public information has been used. UltraTech did not commission, review, or endorse this study — it is used solely as a realistic case-study anchor. See Disclaimer.

UltraTech Cement Limited, part of the Aditya Birla Group, is India's largest cement manufacturer, with a domestic grey cement capacity of roughly 205.5 million tonnes per annum on a consolidated basis. Its Ready-Mix Concrete business — UltraTech Concrete — is, by the company's own public disclosure, India's largest RMC and white cement manufacturer, operating a network the company describes as around 465 RMC plants across 167 cities nationally.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 9 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

10 Market Background

South Gujarat sits inside the Mumbai–Ahmedabad economic corridor and comprises five administratively and economically distinct districts, each with a different demand character:

District Character RMC Demand Driver

Diamond & textile hub; one of India's fastest- Residential and mixed-use verticalisation; Surat

Surat

growing cities Metro Rail Phase 1

Petrochemical belt — Ankleshwar GIDC, Dahej Industrial and logistics infrastructure; Bulk Drug

Bharuch

PCPIR Park at Jambusar

Industrial belt bordering Vapi/Daman, NH-48 Warehousing, light industry, residential catch-up

Valsad

connectivity demand

PM MITRA Textile Park and associated road

Navsari Emerging textile and manufacturing corridor

infrastructure

Predominantly rural/tribal district, least Limited but real infrastructure and tourism-linked

Tapi

urbanised development

The region benefits from two overlapping tailwinds that this study treats as context, not as inputs baked directly into the demand model: the state's own Gujarat Industrial Policy 2026, targeting cumulative investment in the order of ₹10 lakh crore, and continued national-corridor investment through the Delhi-Mumbai Industrial Corridor, which planning bodies have previously sized at up to roughly USD 90 billion in overall investment potential across its full alignment. Gujarat Industrial Development Corporation (GIDC) separately maintains over 200 industrial estates statewide, a meaningful share of them within these five districts.

These macro programmes matter because they are the source of the 22 named infrastructure projects in the demand base (Section 20) — the Surat Metro, the Bhadbhut Barrage, the Delhi-Mumbai Expressway's Gujarat packages, and the Bulk Drug Park works among them — rather than because they were used to inflate or extrapolate the private-project demand figures, which are built bottom-up from GujRERA records independently of the policy narrative.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 10 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

11 Business Challenges

Five structural challenges emerge from the data itself, ahead of any deeper analysis in later sections. Each is carried through into the Risk Register (Section 22) with a formal probability-impact score.

- Demand concentration. Surat district alone holds 78.5% of all registered projects and roughly 70% of TAM value. A South Gujarat strategy is, in practice, substantially a Surat strategy, with the other four districts as options rather than co-equal legs.
- Uneven competitive visibility. Competitive intelligence is strong in Surat (16 of 19 competitors verified) and materially weaker in the smaller districts (as low as 1 of 9 verified in Tapi). Expansion decisions in thinly-verified zones carry more model risk than the headline numbers suggest.
- A crowded, rated field. 24 of 66 mapped competitors carry a High strategic-threat rating. New capacity does not enter an empty market.
- Delivery-radius physics. RMC's limited post-batching workability window means plant siting — not just aggregate district demand — determines how much of the modelled TAM a given plant can actually reach.
- Genuine downside scenario risk. The Pessimistic case in the financial model is not a token stress test — it is value-destructive (IRR -10.9%, negative NPV), meaning the investment case depends on Base-case assumptions holding up in practice, not merely on the Optimistic case being possible.

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

12 Data Sources

Three independent data sources feed the model, each with a different collection method and a different, explicitly tracked confidence level.

Source Feeds Coverage / Confidence

100% source-linked (every record

Market_Data sheet — 3,065

Gujarat Real Estate Regulatory carries a GujRERA reference); 613

residential, commercial, mixed-use and

Authority (GujRERA) project registry records (20.0%) flagged for BUA

plotted-development projects

review

Public infrastructure disclosures — 22 of 22 flagged “Include in TAM;” 6

NHAI, Gujarat Metro Rail Corporation, Infrastructure_Projects sheet — 22 of 22 had cost/demand figures

Sardar Sarovar Narmada Nigam Ltd., named public projects corrected against primary sources

GIDC, PIB releases, state DPRs during review

Desk-research competitor mapping — 29 of 66 (43.9%) independently

Competitors sheet — 66 named RMC

company websites, business verified; balance carry analyst-

operators across 5 zones

directories, physical-presence checks estimated capacity and pricing

Internal desk estimates; explicitly

Construction-industry benchmarks —

not sourced to an external vendor

concrete-intensity ratios and district Assumptions_Market sheet

rate card (see Assumptions, Section

pricing

17)

DATA NOTE Why this matters

A model is only as credible as its weakest input source. Rather than blending all three sources into a single undifferentiated number, this study carries source confidence through every layer — project-level flags, a district-level data-quality tier (Section 23), and a named verification rate for competitors — so the Executive Summary's headline figures can be traced back to exactly how sure the underlying data really is.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 12 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

13 Data Collection Process

- Project-level demand. Registered projects were pulled from the GujRERA registry for all five districts, retaining project name, developer, category, status dates, and declared built-up area (BUA). Each record was assigned a unique ID and a source hyperlink back to its registry entry.
- Demand conversion. Declared BUA was converted into estimated concrete demand using category-

specific concrete-intensity ratios (m^3 per m^2 of BUA), then priced using district-specific average rates per m^3 (Assumptions_Market sheet) to derive an estimated market value per project.

- Infrastructure projects. The 22 public projects were compiled individually from official announcements and DPRs rather than from a single registry, given the absence of a unified public database for infrastructure works; each carries its own cost, concrete-demand estimate, verification status, and sourcing note.
- Competitor mapping. Competitors were identified zone-by-zone through public listings and directory research, then scored on estimated capacity, market position, pricing level, and strategic threat, with an explicit Verified / Not Verified flag recorded for each.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 13 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

14 Data Cleaning

The Analytical Model carries its own documented correction history — a meaningful positive signal in itself, since a model that shows its revisions is more auditable than one presenting false precision. Four corrections are logged directly in the model's Assumptions_Log Section:

- BUA outlier flagging. 613 of 3,065 projects (20.0%) fall outside the expected built-up-area range for their declared category and are flagged “Review Required.” These records remain in the model — flagging, not silent deletion, was the correct call — but should be prioritised for manual re-verification before any capital commitment.
- Infrastructure cost corrections. 6 of the 22 infrastructure projects had cost or demand figures corrected against primary sources (NHAI, Sardar Sarovar Narmada Nigam Ltd., and a GIDC pre-feasibility report). Two corrections are individually significant: the Surat Metro Rail Phase 1 cost was corrected from what the model's own log describes as a $10\times$ data-entry error, and the Delhi-Mumbai Expressway figure was corrected after an earlier version mistakenly applied the full national-programme cost rather than the cost of the Gujarat packages actually in scope.
- Capex/SAM scale-mismatch correction. An earlier version of the model sized capital expenditure for a single plant while assuming that plant could capture 5–15% of a five-district Serviceable Available Market — a scale mismatch between supply and assumed demand capture. The current version corrects this with the phased three-plant rollout used throughout this report.
- Margin-methodology correction. An earlier version applied a flat 25% gross margin disconnected from its own modelled operating-cost build, which implied a gross margin closer to 15.7% once costs were actually summed. Gross profit is now always computed directly as $(\text{price} - \text{unit cost}) \times \text{volume}$, tying the margin shown to the cost build underneath it rather than to an assumed constant.

Additional Findings From This Review

Two further issues were identified during this analysis, beyond those already logged in the Feasibility Model. Both are flagged here in the interest of the same transparency the model's own author applied to the corrections above.

QA FINDING Finding 1 - ROI formula reconciles with workbook documentation

The Business Model “5-Year Cumulative ROI” cells compute $(1 + \text{discount rate})^5 - 1$ — a compounding of the discount-rate assumption — rather than the $(5\text{-year EBITDA} - \text{total capex}) \div \text{total capex}$ formula stated in the adjacent documentation note, which is also what the Cumulative Cash Flow row directly above it already computes. This report uses the cash-flow-based figure throughout (119.0% Base, 291.7% Optimistic, -25.9% Pessimistic) since it is both the documented intent and the economically meaningful number; the underlying cell formula should be corrected to match its own label before this model is used for a live decision.

QA FINDING Finding 2 — narrative fields have not been refreshed to match current model outputs

Several free-text fields in the Executive_Summary model section quote figures from an earlier state of the model. The narrative cites a TAM/SAM of roughly ₹24,161.60 Cr / ₹23,455.21 Cr, against ₹26,760.22 Cr / ₹25,943.41.97 Cr in the current live calculation; it cites the Bhadbhut Barrage at roughly ₹4,167 Cr against the current ₹5,322.19 Cr; and the Delhi-Mumbai Expressway at roughly ₹1,677.33 Cr against a current calculated market value of ₹297.00 Cr. This is a structural issue, not a one-off typo: some Executive_Summary cells are live formulas that update automatically (e.g. the financial-feasibility and final-decision fields), while others are static text written at a point in time and not refreshed after the corrections above were made. This report uses the live-calculated figures throughout and treats the static text as superseded.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 14 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

QA FINDING Finding 3 — one infrastructure project's concrete value exceeds its own total project cost

Of the 22 infrastructure projects, the NH-56 Upgradation (Vyara Taluka) is recorded with a total project cost of ₹285.00 Cr but an estimated RMC market value of ₹325.13 Cr — 114% of its own total cost. Since concrete is one input among several in any road project, its estimated value cannot legitimately exceed the project's total cost; either the per-kilometre concrete-intensity benchmark applied here is too aggressive for an “upgradation” (widening/strengthening) project versus new construction, or the ₹285 Cr cost figure itself understates the project's true scale. This is an isolated case — no other project in the register shows this inconsistency — but it should be corrected before the ₹3,799.95 Cr infrastructure TAM figure is relied upon for a live decision.

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

15 Data Preparation

Raw registry and desk-research data was engineered into model-ready fields through a consistent set of derived columns:

- Status derivation. Project status (Ongoing / Completed) is derived live from each project's declared completion date against today's date, rather than stored as a static label — the model self-updates as projects complete.
- Scale tiering. Each project is tiered Small / Medium / Large by estimated concrete demand, giving a quick sense of pipeline composition beyond raw counts (1,533 Small, 1,325 Medium, 207 Large in the current extract).
- Concrete-intensity lookup. Estimated concrete demand is computed by looking up a category-specific intensity ratio (m³ per m² of BUA) from the Assumptions_Market Evidenceset and applying it to each project's declared BUA — not a flat ratio applied across all categories.
- Market-value conversion. Estimated market value combines the demand figure with a district-specific average price per m³, so a Surat project and a Tapi project of identical size are correctly priced differently.
- Competitor scoring. Each competitor's Threat Score blends estimated capacity, market position, and pricing level into a single ranking, which then rolls up into an Overall Priority tag (e.g. “High Priority”) used to shortlist the competitors that matter most in Section 19.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 16 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

16 Data Modelling

The Analytical Model is built as a relational model across 11 linked Component rather than a single flat sheet — the architecture that makes every downstream figure traceable back to a project-level or competitor-level record.

Model Architecture

- Raw layer: Market_Data (3,065 projects) and Infrastructure_Projects (22 projects) hold project-level source data and derived demand/value fields.
- Reference layer: Assumptions_Market (pricing and intensity benchmarks) and Assumptions_Log (correction history and methodology notes) hold every assumption the raw layer depends on, in one audiEvidenceset place.
- Aggregation layer: TAM_SAM_SOM rolls the raw layer up by district and category using SUMIFS-based formulas against named Excel Evidencesets, then applies reachability and capture-rate assumptions to derive SAM and the five-year SOM path.
- Competitive layer: Competitors holds the 66-operator map with zone-level and market-level rollups (e.g. each zone's share of total mapped RMC capacity).
- Financial layer: Financial_Model consumes the SOM path and plant-rollout assumptions to build a five-year P&L, cash flow, and scenario-tested NPV/IRR/payback.
- Risk layer: Risk_Analysis holds a standalone, independently maintained 19-risk register scored on probability × impact.
- Presentation layer: Dashboard and Executive_Summary compress every layer above into KPI cards, charts, and narrative — partly live-formula-driven, partly static text (see Finding 2, Section 14).

Why the Architecture Matters

Structured Excel Evidencesets and named ranges (rather than raw cell-range formulas) are used throughout the raw and aggregation layers. This is precisely the structure Power Query and Power BI expect as an ingestion source, which is what makes the migration path described in Future Enhancements (Section 28) a realistic next step rather than a rebuild from scratch.

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

17 Assumptions

Every figure in this report ultimately rests on a small set of explicit, audiEvidenceset assumptions, summarised below by category. None are derived from an external vendor rate card — all pricing and intensity benchmarks are internal desk estimates, a limitation carried through consistently rather than disclosed once and forgotten (see Limitations, Section 27).

Demand & Pricing Assumptions

Assumption Basis

Category-specific desk benchmark, consistent with typical IS 456 / IS

Concrete-intensity ratio (m³ per m² BUA)

4926 design practice, applied via lookup rather than a flat ratio

Internal desk estimate calibrated by district; no external vendor rate

Average price per m³, by district

card used

Surat, Bharuch, Valsad modelled at 100% reachable; Navsari and Tapi District reachability factor at 60% ("Partial"), reflecting weaker road/logistics connectivity to a centrally sited plant network

5% → 10% → 15% → 18% → 20% of SAM — a share-gain path, not a SOM capture rate (Year 1 → Year 5)

fixed volume target

Capital & Operating Assumptions

Assumption Value

Capex per plant ₹17 Cr

Plant 1 — Year 1; Plant 2 — Year 2; Plant 3 — Year 3 (steady state

Plant rollout schedule

from Year 3)

Total 3-plant capex (Base case) ₹51 Cr

Annual price escalation ≈ 3% per annum

≈ 22.8%, rising modestly year-on-year as fixed costs are absorbed over

Blended EBITDA margin (Base case)

higher volume

Scenario Assumptions

Scenario Discount Rate Character

Faster utilisation ramp, stronger pricing power, lower perceived

Optimistic 10%

execution risk

Model's central case — used for the headline KPIs throughout

Base 12%

this report

Slower ramp, price pressure from competitors, higher perceived

Pessimistic 15%

execution risk

DATA NOTE A note on the CapEx Payback Volume metric

The model separately reports a per-plant "CapEx Payback Volume" of 115,686 m³ (Year-1 equivalent). This is a unit-economics reference point — the volume at which a single plant's contribution covers its own capex in isolation —

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 18 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Scenario Discount Rate Character

and is explicitly flagged in the model's own notes as not an operating break-even metric. It should not be confused with the payback period reported in Section 21, which is measured on actual multi-plant, multi-year cash flow.

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

18 Market Opportunity Analysis

This section builds the market-sizing bridge from raw project data to a five-year capture path, then breaks the opportunity down by district and by project type.

Total Addressable Market (TAM)

TAM is built bottom-up from two demand pools: 3,065 GujRERA-registered private-sector projects (residential, commercial, mixed-use, and plotted development) worth an estimated ₹22,960.26 Cr in concrete demand, and 22 public infrastructure projects worth a further ₹3,799.95 Cr. Combined, this yields a Total Addressable Market of ₹26,760.22 Cr, equivalent to 44.24 million m³ of concrete demand across 3,087 tracked projects.

Serviceable Available Market (SAM)

Not all of the TAM is realistically reachable from a centrally sited plant network. Surat, Bharuch, and Valsad are modelled at full (100%) reachability given their road connectivity and project density; Navsari and Tapi are modelled at 60% ("Partial") reachability, reflecting greater distance and weaker logistics connectivity to a network anchored further north. This discounting brings SAM to ₹25,943.41.97 Cr — 97.7% of TAM — a smaller haircut than the partial-reachability districts alone would suggest, simply because Navsari and Tapi together represent only a small share of total TAM to begin with.

Serviceable Obtainable Market (SOM)

SOM applies a share-gain capture path to SAM rather than assuming a fixed volume target: 5% in Year 1, rising to 10%, 15%, 18%, and 20% by Year 5 as the plant network matures from one to three plants and builds a reputation and dealer network. This produces Year-1 revenue potential of ₹1,297.17 Cr, scaling to ₹5,188.68 Cr by Year 5.

Figure 1: Market sizing bridge (TAM → SAM → SOM) and five-year SOM capture path

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 20 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

District Opportunity

The SAM breaks down sharply by district, with Surat alone contributing almost three-quarters of reachable demand:

District Reachable Demand (SAM, ₹ Cr) Share of SAM Registered Projects

Surat 18,832.43 72.0% 2,406

Bharuch 3,270.70 12.5% 195

Valsad 3,136.48 12.0% 345

Navsari 703.80 2.7% 115

Tapi 0.00 0.8% 4

Figure 2: District-wise reachable demand (SAM) and registered project count

RISK FLAG Concentration is the headline risk, not a footnote

A 72% SAM share in a single district is a legitimate, data-backed finding, not a modelling artefact — Surat genuinely carries most of the region's construction activity. It does mean that "South Gujarat market entry" is, in financial-return terms, substantially a Surat bet, with Bharuch and Valsad as the more diversifying second moves ahead of Navsari and Tapi. This is carried forward explicitly in the Risk Register (R-18, Section 22) and the phased Strategic Recommendation (Section 25).

Project Distribution

Beyond geography, the 3,065-project pipeline breaks down as follows by category, scale, and status:

Project Category Count Share

Residential / Group Housing 1,201 39.2%

Mixed Development 793 25.9%

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 21 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Project Category Count Share

Plotted Development 543 17.7%

Commercial 528 17.2%

Scale Tier Count Share

Small 1,533 50.0%

Medium 1,325 43.2%

Large 207 6.8%

Status is close to evenly split — 1,603 projects (52.3%) are recorded as Completed and 1,462 (47.7%) as Ongoing — which reads as a healthy, continuously replenishing pipeline rather than a market that has already been substantially built out. Because status is derived live from each project's completion date rather than stored as a static label, this split will continue to shift automatically as the model ages.

Demand Analysis

The average project in the dataset represents roughly 12,352 m³ of concrete demand on a median built-up area of 28,900 m² — consistent with a market of mid-sized residential and mixed-use developments rather than one dominated by a handful of mega-projects. By category, Residential and Mixed Development jointly account for nearly two-thirds of TAM value, with Infrastructure a meaningful fourth pillar despite comprising only 22 individual projects.

Figure 3: TAM composition by demand category

DATA NOTE The 20% still under review

613 of the 3,065 projects (20.0%) carry a “Review Required” flag because their declared built-up area falls outside the expected range for their category. These projects remain in the ₹26,760 Cr TAM figure quoted throughout this

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 22 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

report; they have not been excluded, only flagged. A pre-investment data-quality pass should prioritise re-verifying this subset, concentrated as it likely is among the market's larger, more complex mixed-use developments.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 23 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

19 Competitor Analysis

66 RMC competitors were mapped across the five districts — a mix of national branded players, regional operators, project-captive plants, and a long tail of minor independents. This section reads that field five ways: market share, threat, capacity, pricing, and overall competitive position.

Market Share

No single public source reports RMC market share directly, so this study uses each zone's share of total mapped

batching capacity across the region as a proxy, and — more usefully — cross-references it against each district's share of reachable demand (SAM) from Section 18 to see where capacity and demand are, or are not, in balance:

District Share of SAM (Demand) Share of Mapped Capacity Reading

Under-supplied relative to demand —

Surat 72.0% 33.5%

attractive

Under-supplied relative to demand —

Valsad 12.0% 6.9%

attractive

Capacity-heavy relative to demand —

Bharuch 12.5% 27.7%

see note below

Navsari 2.7% 22.3% Capacity-heavy relative to demand

Capacity-heavy relative to a very small

Tapi 0.8% 9.5%

demand base

INSIGHT Reading Bharuch correctly

Bharuch's outsized capacity share is driven substantially by a single incumbent, Uday Infra Projects, whose listed capacity (45,000–50,000 m³/month) is the largest of any competitor mapped in this study — yet it carries a Low strategic-threat rating, not a High one. Bharuch's genuine attractiveness rests on its infrastructure pipeline and full reachability, not on the RMC competitive field being empty; a new entrant should treat this one incumbent as a named factor to underwrite, not ignore.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 24 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Threat

Figure 4: Competitor base by strategic threat level, and mapped competitors by zone with verification coverage

Of the 66 competitors, 24 (36%) carry a High strategic-threat rating, 26 (39%) Medium, and 16 (24%) Low.

Rolling threat, market position, and pricing together, the model separately tags 22 competitors (33%) as “High Priority” for active monitoring, versus 42 tagged simply “Monitor.”

INSIGHT Threat does not track brand or scale — it tracks price aggression

The four most recognisable branded national players in the dataset — RDC Concrete (India), Nuvoco Vistas, Prism RMC, and ACC Ready Mix — are all rated Low-to-Medium threat and all price at the Premium tier. Every one of the 24 High-threat competitors, by contrast, is a Minor Independent, Local, or Niche-tier operator pricing at the Competitive, Low-Cost, or Cost-Effective tier. The real competitive intensity in this market comes from a swarm of small, price-aggressive local operators — concentrated in Surat and Valsad — not from the branded majors, who appear to compete on quality and reliability rather than on price.

Capacity

Mapped competitor capacity spans an extremely wide range — from roughly 1,000–2,000 m³/month for the smallest niche operators up to 45,000–50,000 m³/month for the single largest incumbent (Bharuch).

Competitor density by zone broadly tracks the market-share Evidenceset above: Surat carries the most competitors (19), followed by Navsari (14), Valsad (13), Bharuch (11), and Tapi (9).

Five of the 66 competitors are tagged Captive / Project-Based — including a named EPC-linked operation (L&T Howden) and a project-captive Surat plant (Wagad Infra) — meaning they primarily self-supply their own

project sites rather than sell into the open market this study's SOM targets. The genuinely contesEvidenceset competitive pool is therefore closer to 61 open-market operators than the full 66.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 25 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Pricing

Pricing Tier Competitors Share

Competitive 23 34.8%

Premium 8 12.1%

Cost-Effective 8 12.1%

Low-Cost 7 10.6%

Mid-Premium 5 7.6%

Mid 5 7.6%

Market Rate 4 6.1%

Internal Cost / Captive / Lowest 6 9.1%

Pricing tiers split cleanly along the same line as the threat finding above: the branded majors anchor the Premium tier, while over half the field (Competitive + Cost-Effective + Low-Cost, 38 competitors, 57.6%) competes on price. A new entrant's pricing strategy needs to be a deliberate choice — compete on brand and consistency at the Premium tier against four well-known names, or compete on price against a much larger and more fragmented field — rather than an attempt to straddle both.

Competitive Position

Verification coverage — the share of mapped competitors independently confirmed via public listings, directories, or physical-presence checks — is uneven and should be read as a confidence weighting on everything above it, not as a footnote:

Zone Competitors Verified Verification Rate

Surat 19 16 84.2%

Navsari 14 5 35.7%

Valsad 13 4 30.8%

Bharuch 11 3 27.3%

Tapi 9 1 11.1%

Total 66 29 43.9%

A representative sample of the 22 competitors flagged High Priority — the full list appears in the Appendix:

Zone Competitor Market Position Capacity (m³/mo) Pricing Verified?

Surat Choudhary RMC Major Regional 4,000–8,000 Competitive Yes

Surat Krishna Concrete Minor Independent 3,000–6,000 Competitive Yes

Surat Dev Infra RMC Minor Independent 3,000–6,000 Competitive Yes

Bharuch Sahyog Infracon Local Mainstay 6,000–7,500 Cost-Effective No

Bharuch Kalyan Construction Local Follower 5,500–7,000 Cost-Effective No

Valsad Kinjal Construction Minor Independent 1,500–4,000 Competitive No

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 26 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Zone Competitor Market Position Capacity (m³/mo) Pricing Verified?

Navsari Infra Concrete Volume Follower 5,000–6,000 Cost-Effective No

Tapi Anjali Infracrete Pvt Ltd Specialist Minor 2,500–3,500 Cost-Effective No

DATA NOTE What the 43.9% verification rate means for this study

Every threat rating, pricing tier, and capacity estimate for the 37 Not Verified competitors should be treated as an informed estimate, not a confirmed fact. This is precisely why the Risk Register (Section 22) carries two dedicated evidence-gap risks (R-12, R-13) and why the Strategic Recommendation gates deeper expansion into Valsad and Tapi on further verification work rather than proceeding on the current field as-is.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 27 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

20 Infrastructure Analysis

22 public infrastructure projects sit alongside the 3,065 private-sector projects in the demand base, contributing ₹3,799.95 Cr in RMC market value — 14.2% of total TAM — against a combined headline project cost across all 22 works of roughly ₹31,241 Cr. The gap between those two figures is expected and important to read correctly: concrete is one input among many (land, steel, mechanical/electrical systems, rolling stock, land acquisition) in a metro line or a barrage, so RMC demand is naturally a modest slice of total project cost — here, about 12% on average.

Composition by District

District Projects RMC Market Value (₹ Cr) Headline Project Cost (₹ Cr)

Surat 8 1,054.61 14,174.80

Bharuch 8 1,654.35 10,115.41

Valsad 2 458.13 3,505.00

Navsari 3 307.74 3,160.50

Tapi 1 325.13 285.00

Surat and Bharuch each host 8 of the 22 projects and together contribute 71% of infrastructure RMC value — Surat through its Metro Rail Phase 1 and Multi-Modal Transportation Hub, Bharuch through the Bhadbhut Barrage and the cluster of works inside the Jambusar Bulk Drug Park. This reinforces, from an entirely separate data source, the same Surat/Bharuch weighting the private-project analysis in Section 18 already showed.

Composition by Project Type

Project Type Projects RMC Market Value (₹ Cr)

Water Infrastructure / Barrage 5 1,690.57

Metro / Mass Rapid Transit 2 742.95

Highway 3 624.69

Industrial Infrastructure 3 557.79

Bridge / Flyover 5 110.14

Industrial Waste Management 2 48.82

Power / Industrial Utilities 1 24.23

Tourism / Institutional 1 0.78

Water infrastructure — principally the Bhadbhut Barrage and the Rundh-Bhatha Barrage — is the single largest category by RMC value, ahead even of the Surat Metro. Four projects (Surat Metro Phase 1, Rundh-Bhatha Barrage, Bhadbhut Barrage, and the PM MITRA Textile Park) are separately tagged “Extreme” strategic importance, reflecting their scale and their anchor role in each district’s broader development narrative.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 28 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Verification Status

DATA NOTE Infrastructure figures carry the same evidence-quality gradient as the competitor data

Of the 22 infrastructure projects, only 1 (4.5%) is independently Verified; 19 (86.4%) are tagged “Benchmark Estimate” and 2 (9.1%) “Needs Validation.” This is consistent with the nature of infrastructure cost data — DPR-stage cost figures are routinely revised as projects move through approval — and is exactly why 6 of the 22 records were already corrected once during this review (Section 14) and why this study treats every infrastructure figure as directional rather than final.

Demand is separately tiered (Tier 1 / Tier 2 / Tier 3) in the same way private projects are tiered

Small/Medium/Large: 9 projects sit in Tier 1, 4 in Tier 2, and 9 in Tier 3, giving the infrastructure pipeline a similarly broad size spread rather than being dominated by one or two mega-projects alone.

QA FINDING One line item needs correction before sign-off

The NH-56 Upgradation project (Tapi) is the one exception to an otherwise internally consistent register: its estimated concrete value (₹325.13 Cr) exceeds its own total project cost (₹285.00 Cr), which is not economically possible since concrete is a subset of total cost. See Finding 3, Section 14, for detail and a recommended fix.

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

21 Financial Model

The financial model converts the Year-1-to-5 SOM capture path from Section 18 into a full P&L, cash flow, and return profile for a phased three-plant rollout, then stress-tests it under three named scenarios.

Capital Structure & Rollout

Capital is deployed in three tranches rather than up front: Plant 1 in Year 1, Plant 2 in Year 2, and Plant 3 in Year 3, at ₹17 Cr per plant (Base case), for total capex of ₹51 Cr by the end of Year 3. This phasing is itself a risk-management choice — it lets Plant 2 and Plant 3 be funded from, and gated on, Plant 1's actual performance rather than committed on day one (see Strategic Recommendation, Section 25).

Revenue Build

Base-case revenue grows from ₹38.24 Cr in Year 1 to ₹129.11 Cr in Year 5, driven by the capacity added in each rollout year, a rising SOM capture rate, and roughly 3% annual price escalation. Five-year cumulative Base-case revenue totals ₹493.17 Cr.

Figure 5: Base case — five-year revenue, EBITDA and margin trajectory

EBITDA & Margin

EBITDA in the Base case grows from ₹8.66 Cr (Year 1) to ₹29.46 Cr (Year 5), for a five-year total of ₹112.20 Cr. Margin is sEvidenceset and gradually improving — 22.56% in Year 1 rising to 22.74% by Year 5 — as fixed operating costs are absorbed over a larger volume base rather than through any assumed step-change in pricing power. This is the corrected margin methodology described in Section 14: gross profit is computed directly as (price – unit cost) × volume in every period, not applied as a flat assumed percentage.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 30 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Cash Flow & Payback

Because capital is phased, net cash flow is negative in Years 0–2 (capex outlays exceed EBITDA while the network is still being built out) and turns decisively positive from Year 3, once all three plants are operating and no further capex is due. Cumulative cash flow crosses zero within Year 3, giving a payback period of 2.88 years in the Base case.

Figure 6: Base case — cumulative cash flow and payback

NPV & IRR

₹30.80 Cr 40.8% 2.88 YRS

NPV (BASE, @ 12%) 5-YEAR IRR (BASE) PAYBACK (BASE)

At a 12% discount rate — the Base case's risk-adjusted required return — the project generates a positive Net Present Value of ₹30.80 Cr over five years, with a 5-year Internal Rate of Return of 40.8%, comfortably ahead of the discount rate and consistent with a project worth funding on financial grounds alone, before any strategic option value from the plant network is counted.

Return on Investment (ROI)

The model's own documentation defines 5-Year Cumulative ROI as (five-year EBITDA – total capex) ÷ total capex. Applying that definition consistently across scenarios — rather than the $(1 + \text{discount rate})^5 - 1$ figure the underlying cell actually computes, flagged as a modelling anomaly in Section 14 — gives:

Scenario 5-Yr EBITDA (₹ Cr) Total Capex (₹ Cr) Cumulative ROI

Pessimistic 41.97 56.10 -25.9%

Base 112.20 51.00 119.0%

Optimistic 190.42 48.45 291.7%

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 31 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Scenario Analysis

The model was stress-tested across three scenarios, each with its own price, utilisation, cost, and discount-rate assumptions — a genuine range rather than a single number dressed up with false precision:

Figure 7: Five-year scenario comparison — NPV, IRR, and payback

Metric Pessimistic Base Optimistic

Discount rate 15% 12% 10%

Total capex (₹ Cr) 56.10 51.00 48.45

5-yr revenue (₹ Cr) 401.58 493.17 628.79

5-yr EBITDA (₹ Cr) 41.97 112.20 190.42

Blended EBITDA margin 10.5% 22.8% 30.3%

NPV (₹ Cr) -22.86 30.80 93.67

IRR -10.9% 40.8% 88.6%

Payback (years) 6.28 2.88 2.07

RISK FLAG The downside case is genuinely value-destructive — not a token stress test

The Pessimistic scenario returns a negative NPV (-₹22.86 Cr) and a negative IRR (-10.9%), with payback stretching to 6.28 years — close to the useful planning horizon of the model itself. This is the correct and useful result of an honest sensitivity test: it means the investment case is not a heads-you-win-tails-you-still-win proposition. It depends on Base-case utilisation, pricing, and cost assumptions holding up in practice, which is precisely why the Strategic Recommendation (Section 25) gates Plant 2 and Plant 3 on Plant 1's actual performance rather than committing to all three on a calendar.

Mitigation — Critical & High Risks

The nine Critical and High risks carry named mitigation actions, since these are the ones that should actively gate the pace of expansion rather than simply being logged and monitored:

- R-17 — Plant location and service-radius selection (Critical). Finalise plant sites only after mapping SAM districts, competitor nodes, and delivery lanes together; prioritise Surat, Valsad, and Bharuch coverage before partial-reachability zones.
- R-18 — Surat demand concentration (Critical). Secure anchor customers in Surat first, then deliberately diversify dispatch coverage into Valsad and Bharuch to reduce single-district exposure.
- R-19 — SOM capture ramp (Critical). Gate expansion spend to signed builder/contractor onboarding milestones tied explicitly to the Year 1, Year 2, and Year 3 SOM targets — not to the calendar alone.
- R-11 — Raw-material and unit-cost break-even (High). Lock cement, aggregate, sand, admixture, and logistics supply terms before the volume ramp begins; monitor unit-cost variance against model inputs monthly.
- R-12 — Competitive pricing pressure (High). Use project-specific pricing bands anchored to the model's average price; avoid blanket discounting against the low-cost local operators identified in Section 19.
- R-13 — Customer acquisition (High). Build a priority account pipeline directly from the high-demand Market_Data projects and target their builders/contractors ahead of capacity commitment.
- R-14 — Project pipeline validation (High). Validate the live project pipeline against RERA and infrastructure sources before relying on demand beyond what is already confirmed in Market_Data and TAM/SAM/SOM.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 34 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

- R-15 — Mixed-development and residential concentration (High). Balance sales effort across mixed-use, residential, and commercial accounts; avoid depending on any single project category for Year-1 capture.
- R-16 — Logistics and delivery reliability (High). Plan the plant and fleet configuration around route density and dispatch reliability; prioritise projects with repeat evidence set, plannable delivery lanes.

INSIGHT The ten Medium risks are not immaterial

Several Medium-rated risks — R-06 and R-07 in particular, which flag that industrial and infrastructure demand should not be counted until independently sourced and validated — are effectively a standing instruction not to over-claim on this study's own demand base. Full mitigation text for all ten Medium risks is included in the Appendix.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 35 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

23 Dashboard Analysis

The Analytical Model Dashboard analysis compresses all eight preceding layers into a single screen, designed to be read in the five minutes typically available at the start of an investment-committee meeting. It is organised in four panels.

Panel 1 — Market Headline

3,087 44.24M m³ ₹26,760 Cr ₹1,297.17 Cr

TOTAL PROJECTS TOTAL DEMAND TAM SOM — YEAR 1

Panel 2 — Financial KPIs (Base Case)

₹30.80 Cr 40.8% 2.88 YRS 22.8%

NPV @ 12% IRR (5-YR) PAYBACK EBITDA MARGIN

Panel 3 — Data Quality by District

The dashboard rates each district's underlying data confidence directly, based on GujRERA project-record volume: Surat is rated High confidence (2,406 records); Bharuch, Valsad, and Navsari are rated Medium (115–345 records each); Tapi is rated Low, with only 4 records. This tiering is exactly why the Strategic Recommendation treats Tapi as an observation zone rather than an expansion target (Section 25).

Figure 9: Sample coverage and data-confidence tier by district

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 36 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

Panel 4 — Decision

The dashboard's own decision logic — built from the same NPV, IRR, and payback figures reported in Section 21 — resolves to a single output: GO. This report's Strategic Recommendation (Section 25) adopts that decision but adds the phasing and gating conditions the single-cell dashboard output cannot express on its own.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 37 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

24 Executive Insights

Pulling the threads from Sections 18–23 together, six findings stand out as the ones that would change how an investment committee reads this opportunity — beyond the headline GO recommendation itself.

- Surat is the thesis, not a footnote. At 72% of SAM and 78.5% of registered projects, this is fundamentally a Surat market-entry decision with three smaller options attached, not a five-district strategy with five equal legs.
- The real competitive threat is scale, not brand. The four branded national players in the competitor map (RDC Concrete, Nuvoco Vistas, Prism RMC, ACC Ready Mix) all rate Low-to-Medium threat at Premium pricing; every High-threat competitor is a small, price-aggressive local operator. Pricing strategy needs to pick a lane deliberately.

- The financial case clears the bar, and the downside case is real. A 40.8% Base-case IRR against a 12% hurdle is a genuinely attractive spread — but the Pessimistic case is value-destructive (-10.9% IRR), not a token stress test. Both facts matter equally to the recommendation.
- Data confidence is a gradient built into every layer of this model, not a caveat bolted onto the end. 20.0% of private projects are BUA-flagged, 43.9% of competitors are verified, and just 4.5% of infrastructure projects are independently verified — and the model's own risk register (R-06, R-07, R-12–R-14) already treats this gradient as an active constraint on what can be claimed, not a footnote to disclose once.
- A model that documents its own corrections is a more trustworthy model, provided the fixes get made. Four corrections are logged in the Analysis Framework own history; this review adds three more (the ROI formula, stale Executive_Summary narrative fields, and the NH-56 cost/value inconsistency). None of the three new findings is disqualifying — all three are quick, mechanical fixes — but none should still be open when this model is next presented to a live investment committee.
- Infrastructure demand is a genuine fourth pillar, not a rounding error. At 14.2% of TAM and anchored by four “Extreme” strategic-importance projects (the Surat Metro, two barrages, and the PM MITRA Textile Park), infrastructure demand diversifies the revenue base away from pure residential-cycle exposure — real, if presently only 4.5% independently verified.

25 Strategic Recommendation

GO — PHASED AND MILESTONE-GATED

Commit to Plant 1 in Surat now. Treat Plants 2 and 3 as gated options, not calendar commitments.

Phase 1 — Commit Now

- Build Plant 1 in Surat, sequenced to serve the highest-density, best-verified demand cluster in the entire study (2,406 projects, 84.2% competitor-verification rate — the strongest evidence base of any district).
- Price at the Premium tier where competing directly with the four branded national players, and at the Competitive tier where the primary competition is the local independent swarm — a deliberate, account-by-account choice rather than one blanket price list.
- Fix the three data-quality items flagged in this review before the model is next presented to an investment committee: maintain the ROI formula link to workbook source outputs (Section 14, Finding 1), refresh the static Executive_Summary

narrative fields (Finding 2), and correct the NH-56 cost/value inconsistency (Finding 3). None require new data collection — all three are same-day fixes.

Phase 2 — Gate, Don't Calendar

Plant 2 (Bharuch or Valsad) and Plant 3 should be released against milestones, not a fixed timeEvidenceset:

- Utilisation gate. Plant 1 should demonstrate Year-1 utilisation consistent with the Base case (not the Optimistic case) before Plant 2 capital is committed.
- Verification gate. Competitor verification in the target expansion zone should be lifted materially above its current level (30.8% in Valsad, 27.3% in Bharuch) through targeted desk and field research before pricing and siting decisions are finalised there.
- Demand-confirmation gate. For Bharuch specifically, confirmed off-take signals from the Bulk Drug Park cluster or the Bhadbhut Barrage's construction schedule should be in hand — given Bharuch's unusually large single incumbent (Uday Infra Projects, Section 19), entering on demand confirmation rather than on the raw TAM figure reduces the risk of adding capacity into an already-served pocket.

Treat as Observation Zones, Not Near-Term Targets

Navsari and Tapi together represent 3.5% of SAM and carry the weakest data confidence in the study (Tapi: 4 registered projects, 11.1% competitor verification). Neither warrants a dedicated plant on current evidence; both are worth re-scoring annually as the GujRERA registry and infrastructure pipeline mature.

26 Conclusion

South Gujarat presents a genuinely attractive, evidence-backed Ready-Mix Concrete market-entry opportunity: a ₹26,760 Cr addressable market, a financeable phased capital plan returning a 40.8% five-year IRR in the Base case, and a competitive field that is crowded but legible — not a black box. The opportunity is concentrated in Surat, the competitive threat comes from price-aggressive local operators rather than branded majors, and the downside scenario is real enough to demand discipline rather than blind commitment.

The recommendation that follows from the data is not a blanket GO on five districts and three plants simultaneously — it is a GO on Plant 1 in Surat now, with Plants 2 and 3 earned through Plant 1's own performance against named, measurable gates. That is both the financially sound reading of this model and the version of “GO” an investment committee could actually defend a year from now.

27 Limitations

This study's conclusions are only as strong as the data and assumptions beneath them. Stated plainly, alongside the QA findings already flagged in Section 14:

- Single-source demand base. Private-sector demand is sourced entirely from the GujRERA registry; construction activity that falls outside RERA registration (small-scale, non-registrable, or informal work) is not captured and would understate TAM to an unknown degree.
- Benchmark, not vendor-sourced, pricing and intensity assumptions. Every price-per-m³ and concrete-intensity ratio in the model is an internal desk estimate, explicitly not sourced to an external vendor rate card (Section 17).
- Desk-research-only competitive intelligence. 56.1% of mapped competitors (37 of 66) are not independently verified; capacity, pricing, and threat ratings for this group are analyst estimates, not confirmed data.
- Infrastructure figures are predominantly unverified. 86.4% of infrastructure projects are tagged “Benchmark Estimate” and only 4.5% “Verified;” cost and demand figures for major works like the Surat Metro and the Bhadbhut Barrage should be expected to move as those projects progress through approval and execution.
- 613 projects (20.0%) remain BUA-flagged. These records are included in TAM as-is; they have not been excluded, only flagged for future re-verification.
- Three modelling anomalies identified in this review remain open in the source Financial Model — the ROI cell formula, stale Executive_Summary narrative text, and the NH-56 cost/value inconsistency (Section 14, Findings 1–3). None invalidate the broader conclusions, but all should be corrected before this model informs a live capital decision.
- National RMC market-size estimates vary widely by research methodology (Section 8), which is a

reminder that even this study's district-level, bottom-up figures carry real uncertainty bands, not false precision.

- No primary research was conducted. No developer interviews, competitor pricing checks, or site visits were performed; every figure is a desk-research estimate.
- This is a single point-in-time snapshot. The GujRERA registry, competitor landscape, and infrastructure pipeline will all move; the model should be refreshed on a defined cadence (see Future Enhancements) rather than treated as a one-time deliverable.

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

28 Future Enhancements

Immediate (Days)

- Correct the three items flagged in Section 14: the ROI formula, the stale Executive_Summary narrative fields, and the NH-56 cost/value inconsistency.
- Re-verify a first batch of the 613 BUA-flagged private projects, prioritising the largest by estimated value.

Near-Term (Weeks)

- Lift competitor verification in Valsad, Bharuch, and Tapi through targeted desk and field research — directly closing the evidence gap the Risk Register already names (R-12, R-13).
- Migrate the model's Excel Evidencesets into Power Query, and rebuild the Dashboard model section as a live Power BI report with drill-through from district → project → source record.

Medium-Term (Months)

- Connect the Market_Data sheet to a scheduled GujRERA data refresh so the model's project counts and demand figures update on a defined cadence rather than as a one-time extract.
- Replace straight-line district reachability assumptions with actual road-network drive-time modelling for plant-siting decisions.
- Extend scenario analysis beyond the three named cases to a Monte Carlo simulation across the key uncertain inputs (capture rate, price escalation, utilisation ramp), to express the return profile as a distribution rather than three points.
- Source and add Industrial/Manufacturing-category demand once a suiEvidenceset data source is identified — currently absent from the model, per Section 7, purely as a data-availability gap.

29 Skills Demonstrated

This case study was built to demonstrate end-to-end Business Analyst and Data Analyst capability — from raw data to boardroom recommendation — across eight specific skill areas:

Skill Area Where Demonstrated in This Project

Problem framing (Section 5), objective-setting (Section 6), and translating 11 model

Business Analysis

section of raw data into an investment-committee-ready recommendation (Section 25)

Structured Excel Evidence sets, SUMIFS-based aggregation, INDEX/MATCH lookups,
Advanced Excel TODAY()-driven status derivation, and a fully linked 11-sheet Analytical Model architecture
(Section 16)
Named-Evidence set, source-linked raw data layer (Market_Data, Infrastructure_Projects)
Power Query Readiness
built in the exact structure Power Query expects as an ingestion source
Phased multi-plant capex, 5-year P&L, NPV/IRR/payback, and three-scenario stress-testing

Financial Modelling

(Section 21)
Single-screen KPI, data-quality, and decision-panel design intended for a five-minute
Dashboard Design
executive read (Section 23)
TAM → SAM → SOM market-sizing bridge, competitor threat-scoring model, and a formal
Business Intelligence
19-risk probability-impact register (Sections 18, 19, 22)
Nine purpose-built charts translating raw model output into board-ready visuals (Figures
Data Visualization
1–9, this document)
Independent identification and documentation of three modelling anomalies (Section 14)
Power BI Readiness & Data

30 Appendix
A1. Glossary of Terms
Term Definition
Total Addressable Market — the full concrete-demand value of every tracked project across all five

TAM

districts
SAM Serviceable Available Market — TAM adjusted for realistic delivery reachability by district
SOM Serviceable Obtainable Market — the modelled revenue capture path against SAM over five years
Built-Up Area — a project's declared constructed floor area, in square metres, used to derive

BUA

concrete demand
RMC Ready-Mix Concrete — factory-batched concrete delivered to site, as opposed to site-mixed concrete
Net Present Value — the discounted present-day value of a project's future cash flows, net of initial

NPV

investment

IRR Internal Rate of Return — the discount rate at which a project's NPV equals zero

EBITDA Earnings Before Interest, Tax, Depreciation & Amortisation — the model's core profitability measure

Payback Period The time required for cumulative net cash flow to turn positive

Gujarat Real Estate Regulatory Authority — the state's real-estate project registry and primary data

GujRERA

source for this study

Gujarat Industrial Development Corporation — the state agency that develops and manages

GIDC

industrial estates

Petroleum, Chemicals and Petrochemicals Investment Region — a designated industrial investment

PCPIR

zone (e.g. Dahej)

A2. Medium-Risk Mitigation Detail (Risk Register Continued)

Full mitigation text for the ten Medium-rated risks summarised in Section 22:

ID Risk Mitigation

Geographic expansion risk in partial Serve partial zones selectively through confirmed orders rather than

R-01

zones full fixed-capacity deployment.

Prioritize ongoing residential projects with clear completion timelines

R-02 Residential demand conversion risk

and verified RERA status.

Review IRR/ROI after each capture and pricing update; hold expansion

R-03 IRR and ROI sensitivity risk

if returns converge toward pessimistic outputs.

Track monthly booked volume and price realization against

R-04 Revenue downside risk Base/Pessimistic cases; pause discretionary expansion if trends fall below the Base path.

Stage capacity release by booked demand and keep capacity

R-05 Capacity utilization ramp risk

assumptions documented before procurement or plant setup.

Do not count industrial upside until GIDC/industrial customer pipeline

R-06 Industrial demand evidence gap

is separately sourced and added to Business Model evidence.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 44 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

ID Risk Mitigation

Treat infrastructure upside as unmodeled until specific sourced

R-07 Infrastructure demand evidence gap

infrastructure projects and demand are entered.

Pre-clear plant location, environmental compliance, and operating

R-08 Regulatory and zoning risk

permissions before land or plant commitment.

Use NPV as an investment gate and retest if price, capture, cost, or

R-09 NPV downside risk

utilization assumptions move toward the pessimistic case.

Complete the assumption log from validated sources before

R-10 Assumption completeness risk investment committee review; keep model assumptions
audited.

A3. Full Infrastructure Project Register

Tapi Design Mix Niche Minor High No

A5. Visual & Presentation Recommendations for the Live Analysis Framework / Power

BI Version

This document embeds nine purpose-built charts (Figures 1–9) directly. For the live Excel Analytical Model and any future Power BI migration, the following additions are recommended:

- Dashboard screenshot placement. Insert a full-sheet screenshot of the Dashboard model section immediately after Section 23 in any slide or PDF export, cropped to the four KPI panels described there.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 46 of 49

SOUTH GUJARAT RMC MARKET-ENTRY FEASIBILITY INDEPENDENT BUSINESS ANALYTICS CASE STUDY

- Geographic infographic. A Gujarat district map with proportionally sized markers at Surat, Bharuch, Valsad, Navsari, and Tapi, sized by SAM value — a natural complement to Figure 2.
- Competitor bubble chart. Capacity (x-axis) vs. threat score (y-axis), bubble size by zone, colour by pricing tier — would visually reinforce the “threat tracks price, not brand” finding (Section 19) better than a analysis Evidenceset alone.
- Phased-rollout Gantt/roadmap infographic. A simple three-row timeline (Plant 1 / Plant 2 / Plant 3) against the gating milestones in Section 25, suiEvidenceset for a single strategy slide.
- Icon set conditional formatting. Apply a traffic-light icon set (green/amber/red) to the Verification Status and Data Quality columns directly in Excel, so the evidence-confidence gradient is visible at a glance during live model review, not only in this report.
- Power BI drill-through. Once migrated (Section 28), link each Dashboard KPI card to a drill-through page

showing the underlying project-level or competitor-level records — turning every figure in this appendix into a live, explorable dataset rather than a static Evidenceset.

Not commissioned, endorsed, or affiliated with UltraTech Cement Limited. Page 47 of 49
